

Endometriosis: Challenges in Diagnosis

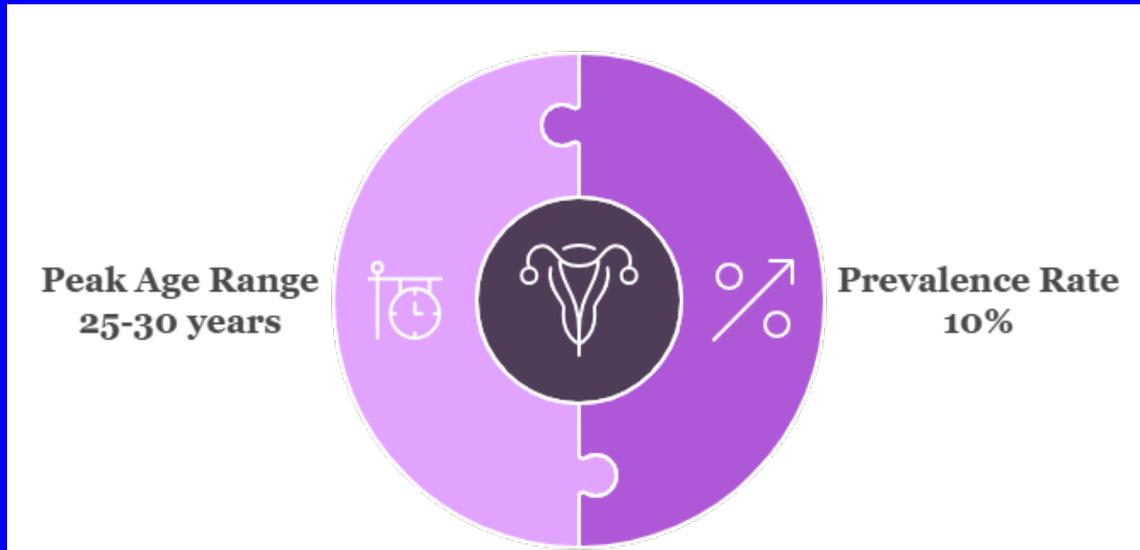

**Hugh S. Taylor, M.D.
Yale School of Medicine**

Disclosures

Contracted Research (Principal Investigators must provide information, even if received by the institution): AbbVie, Organon

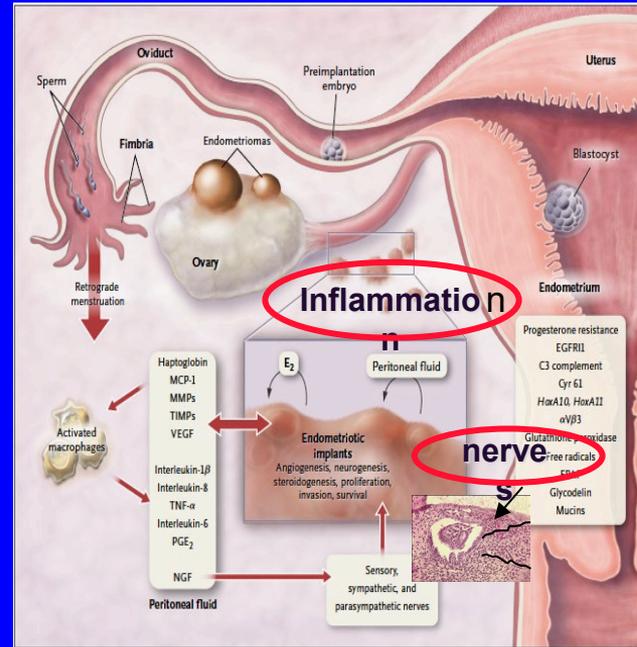

Prevalence

Endometriosis is a public health disorder affecting ~ **250 million** women globally and ~ **10 million** women in the United States.

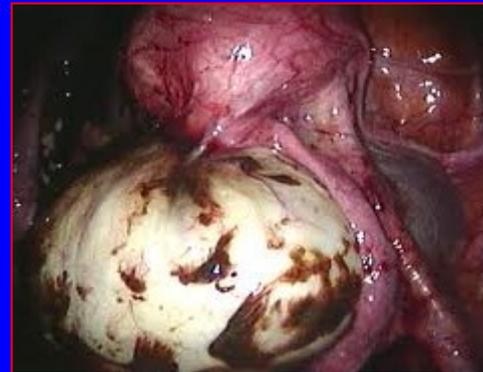

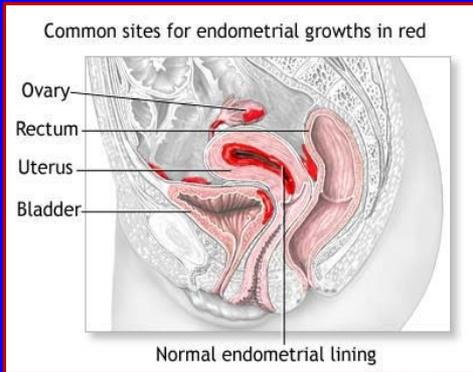

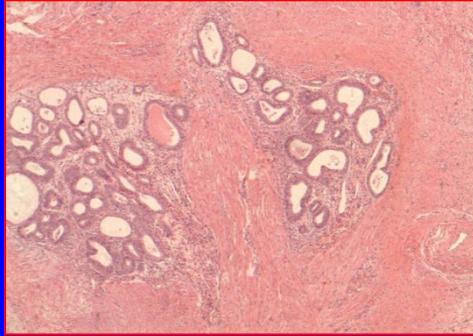

Challenges in diagnosing endometriosis

- 6.7-11 years from symptom onset to definitive diagnosis and treatment
- Many PCPs unfamiliar with disease
- Symptoms are nonspecific or associated with other disorders
- Social norms inhibit conversation
- Pain is subjective
- Survey of n = 7,025 women
 - 65% misdiagnosed
 - 46% saw ≥ 5 MDs to get correct diagnosis

Early diagnosis and treatment can reduce uncertainty, discomfort, disease progression, and later complications

Endometriosis is Ectopic Endometrial Glands and Stroma

Clinical Presentation

- **Pain**
- **Infertility**
- **Asymptomatic**

Disease Stage does not explain pain symptoms.

Percentage at Each Stage

	Stage				
	I	II	III	IV	<i>P</i>
Dysmenorrhea	73	86	72	85	.68
NM Pelvic pain	38	46	36	41	.21
Dyspareunia	30	25	36	29	.91

What you see
in the pelvis is just part
of the disease.

Symptoms Associated with Endometriosis

Pain

Fatigue

Low BMI

Depression

Infertility

Cardiovascular disease

Bowel dysfunction

Inflammation

Anxiety

Bladder dysfunction

Endometriosis is a
systemic disease!

Endometriosis: A Chronic Systemic Disease

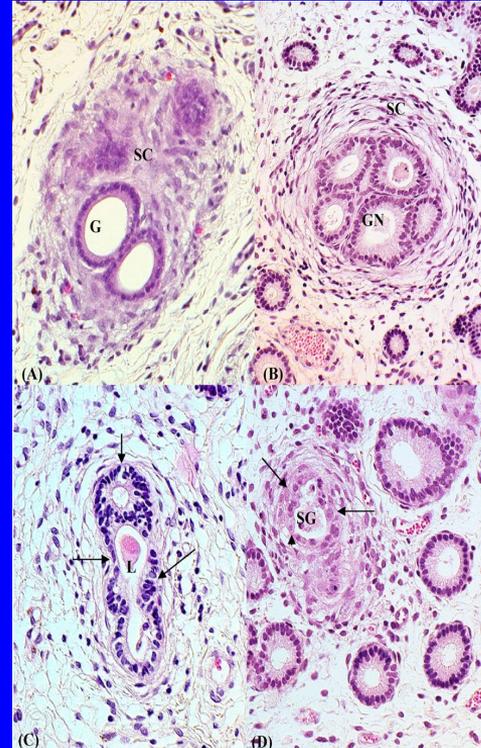

- Varied presentation and diffuse symptoms have traditionally made it difficult for some practitioners to make the diagnosis.

Current limitations in endometriosis diagnosis:

- No non-invasive diagnostic tests
- Requirement for surgical diagnosis is a barrier to timely diagnosis and therapy

Diagnosis

- Gold standard:
 - Direct visualization of endometriotic lesions
 - Laparoscopy or laparotomy
- Signs and symptoms
 - Secondary dysmenorrhea
 - Dyspareunia
 - Infertility
- Gynecological examination
- Imaging:
 - Ultrasonography
 - MRI
 - CT
- Serum biomarkers

Clinical Presentation

Symptoms vary but typically reflect area of involvement and may include:

- Dysmenorrhea
- Cyclical/noncyclical pelvic pain
- Lower abdominal or back pain
- Dyschezia, often with cycles of diarrhea/constipation
- Bloating, nausea, and vomiting
- Inguinal pain
- Dysuria
- Dyspareunia
- Nodules may be felt upon pelvic exam
- Typically develops on pelvic structures, ie, rectovaginal septum, bladder, bowel, intestines, ovaries, and fallopian tubes
- Ovaries most common locations; gastrointestinal tract, urinary tract, soft tissues, and diaphragm follow
- Imaging may indicate pelvic mass/endometriomas.
- Less commonly found in distant regions, eg, diaphragm, lungs (inducing catamenial pneumothorax), and rarely, areas far outside abdominopelvic region

Physical Findings

- **Physical Examination**
 - **Pelvic tenderness**
 - **Uterosacral nodularity**
 - **Fixed or retroverted uterus**
- **Limitations of Physical Exam**
 - **May be normal**
 - **Deep lesions not palpable**

Chronic Pelvic Pain Associated with Endometriosis

- **Cyclic**
- **Progressive**: over time, pain worsens or changes in character
- Cyclic bladder- and bowel-associated symptoms (nausea, distention, and early satiety)

Chronic Pelvic Pain Syndromes Confused with Endometriosis

Other gynecologic conditions:

- Pelvic inflammatory disease
- Pelvic adhesions
- Ovarian cysts or masses (including ovarian cancer)
- Leiomyomata
- Adenomyosis
- History of sexual abuse

Non-gynecologic conditions:

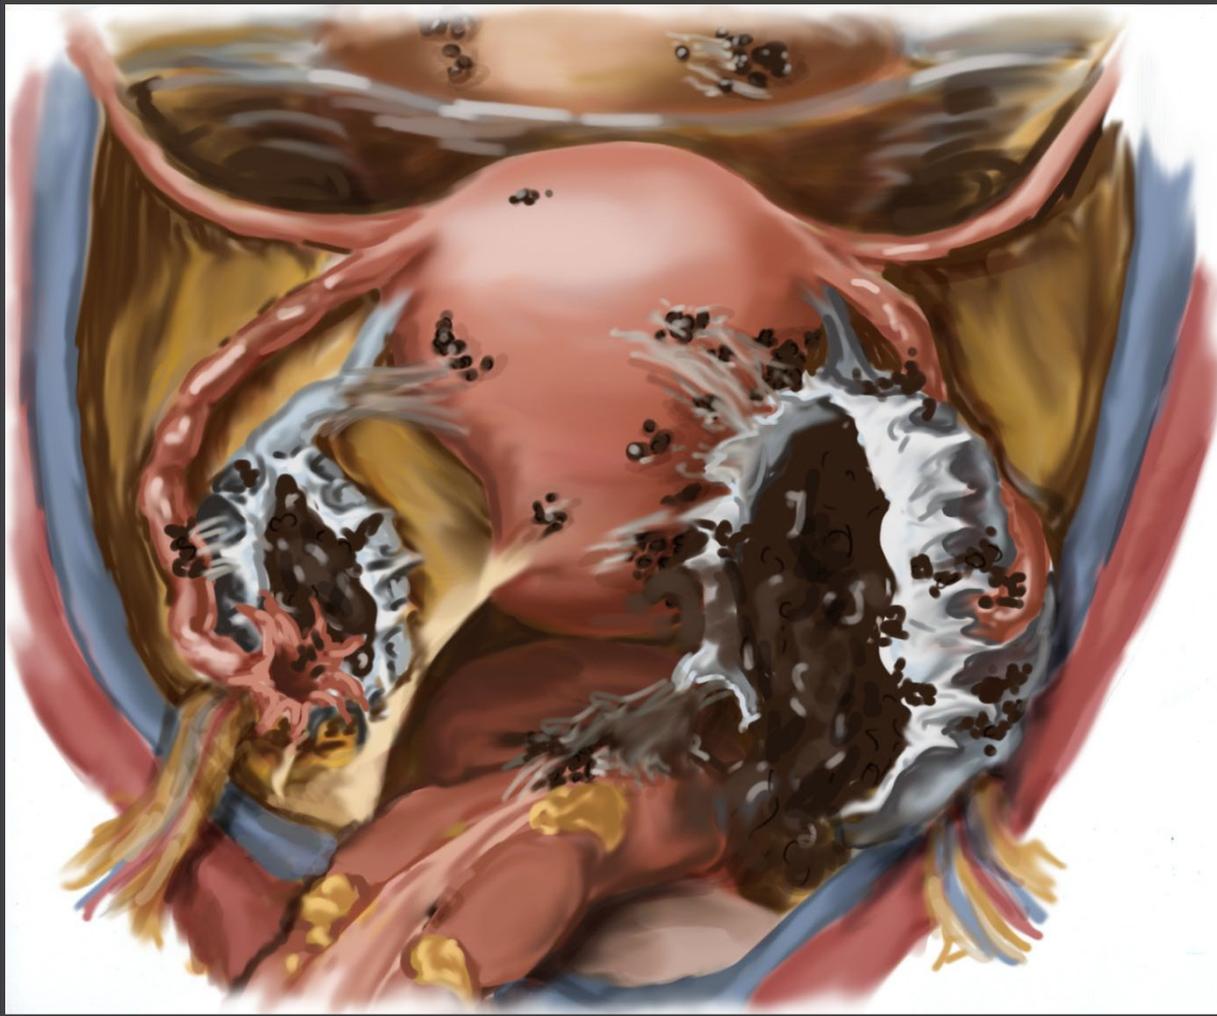

- Irritable bowel syndrome
- Inflammatory bowel disease
- Interstitial cystitis
- Myofascial pain
- Depression

Endometriosis is a biologically complex,
chronic, systemic disease;

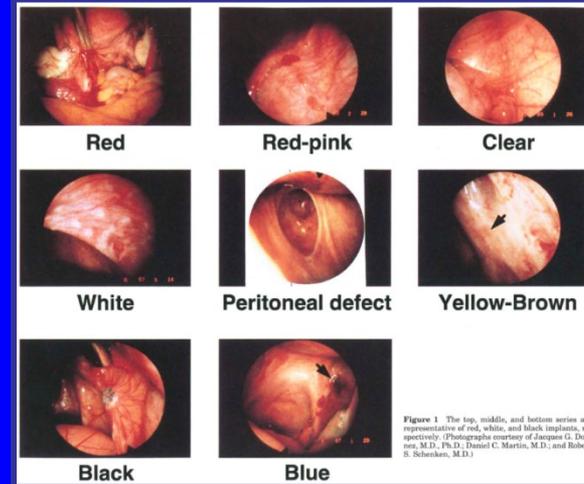

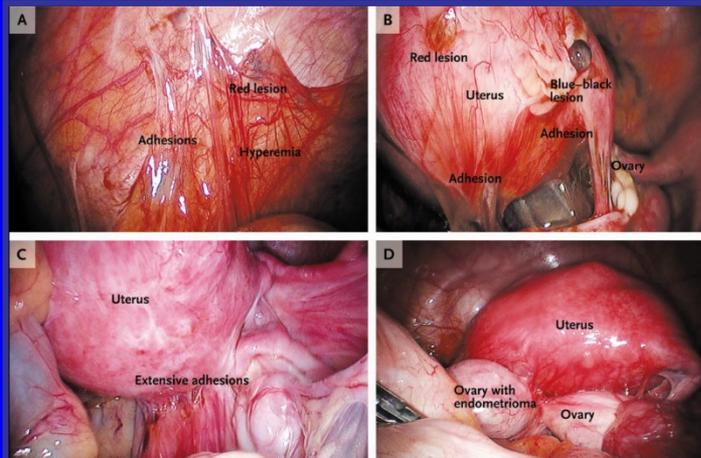

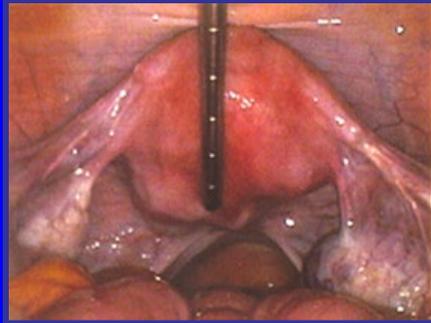

however clinically it is easily recognized
and treated.

Laparoscopy/laparotomy

- Pros:
 - “Gold standard”
 - Can also remove lesions
- Cons
 - Invasive procedure
 - Has its own risks/morbidity
 - Costly
 - Still difficult to detect microscopic and/or subperitoneal lesions
 - Accuracy depends on the skill levels of surgeons

Surgical Diagnosis

Subtleties in
appearance can
lead to
misdiagnosis

Normal Peritoneum has Endometriosis in 25% of Women with PP

- **Unsuspected endometriosis documented in visually normal peritoneum.**

Murphy AA, Green WR, Bobbie D, dela Cruz ZC, Rock JA.
Fertil Steril. 1986;46(3):522-4

Only 45% of Visualized Endometriosis Confirmed by Histology

- A prospective study of 44 patients undergoing laparoscopy for the evaluation of chronic pelvic pain.
- The positive predictive value was 45%.

Clinical Presentation

Symptoms vary but typically reflect area of involvement and may include:

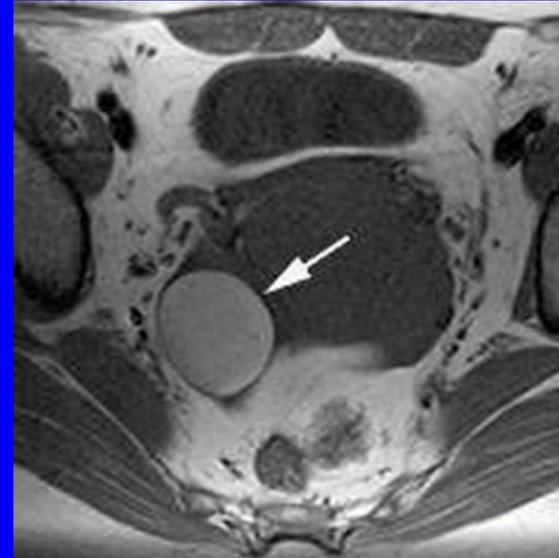

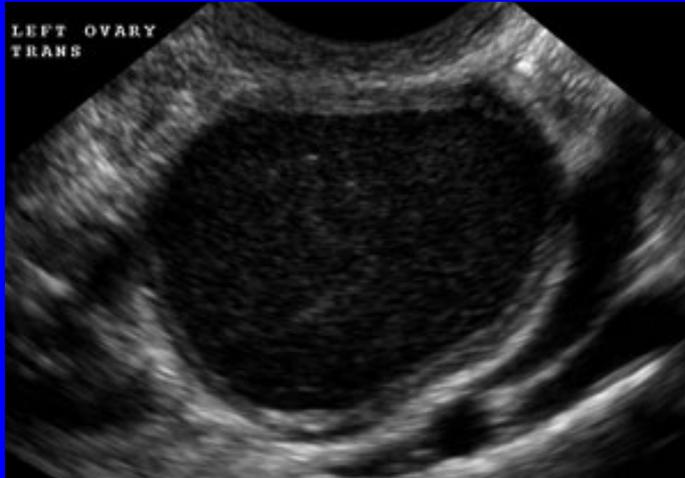

- Dysmenorrhea
- Cyclical/noncyclical pelvic pain
- Lower abdominal or back pain
- Dyschezia, often with cycles of diarrhea/constipation
- Bloating, nausea, and vomiting
- Inguinal pain
- Dysuria
- Dyspareunia
- Nodules may be felt upon pelvic exam
- Typically develops on pelvic structures, ie, rectovaginal septum, bladder, bowel, intestines, ovaries, and fallopian tubes
- Ovaries most common locations; gastrointestinal tract, urinary tract, soft tissues, and diaphragm follow
- Imaging may indicate pelvic mass/endometriomas.
- Less commonly found in distant regions, eg, diaphragm, lungs (inducing catamenial pneumothorax), and rarely, areas far outside abdominopelvic region

Laparoscopy/laparotomy

- Pros:
 - “Gold standard”
 - Can also remove lesions
- Cons
 - Invasive procedure
 - Has its own risk of morbidity and, rarely, mortality
 - Costly
 - Still difficult to detect microscopic and/or subperitoneal lesions
 - Accuracy depends on the skill levels of surgeons

Major Barrier to Early Diagnosis

Endometriosis – U/S or MRI

Transvaginal Ultrasound

- First-line imaging
 - Best for endometriomas
 - “Ground-glass” appearance
- Ultrasound Limitations
 - Poor for superficial disease
 - Operator dependent

MRI in Endometriosis

Deep infiltrating disease

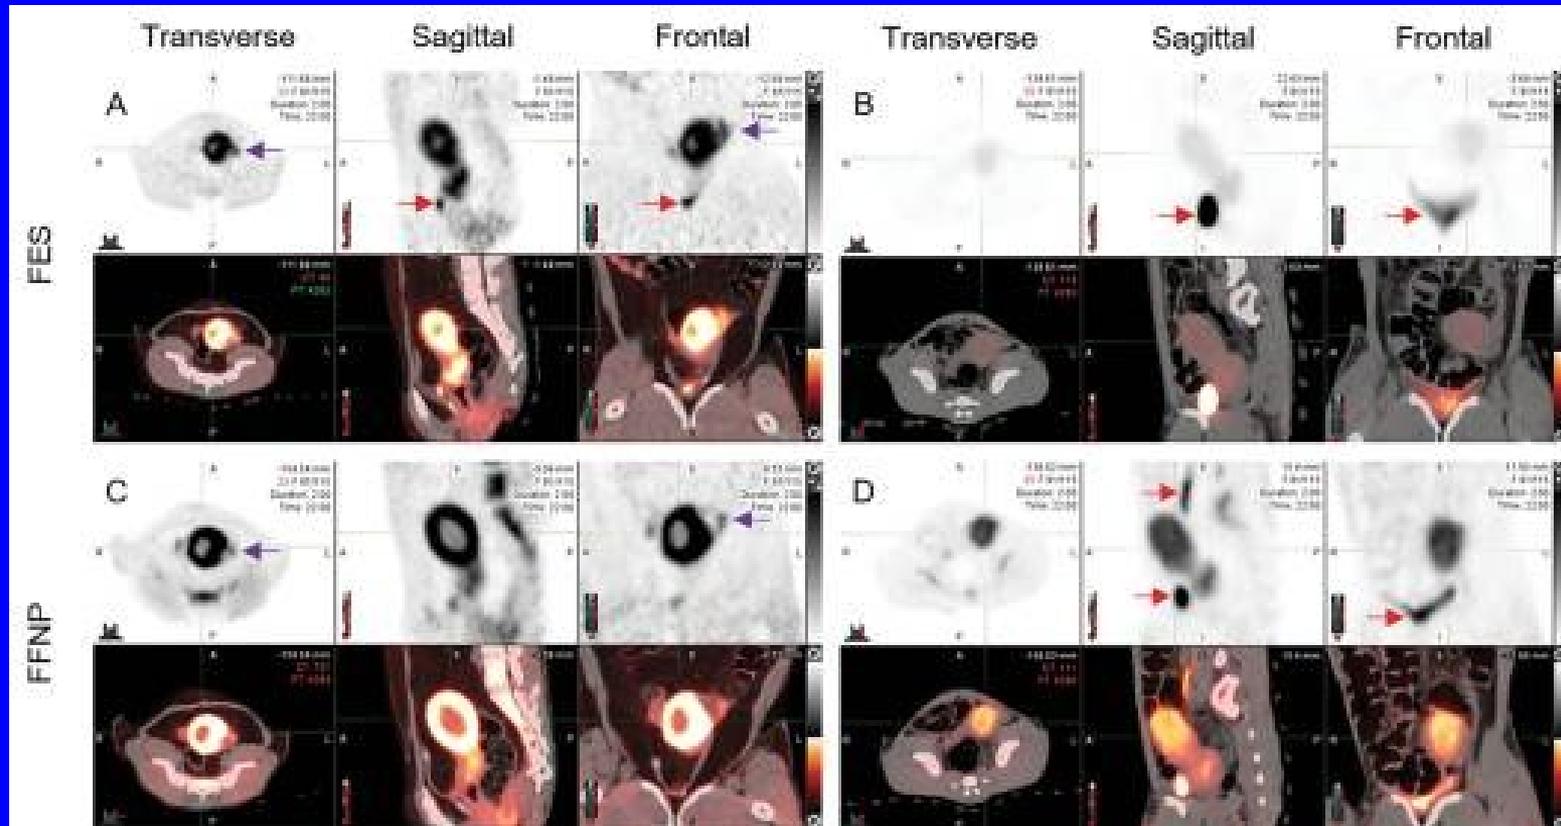

Pre-surgical mapping

High soft-tissue contrast

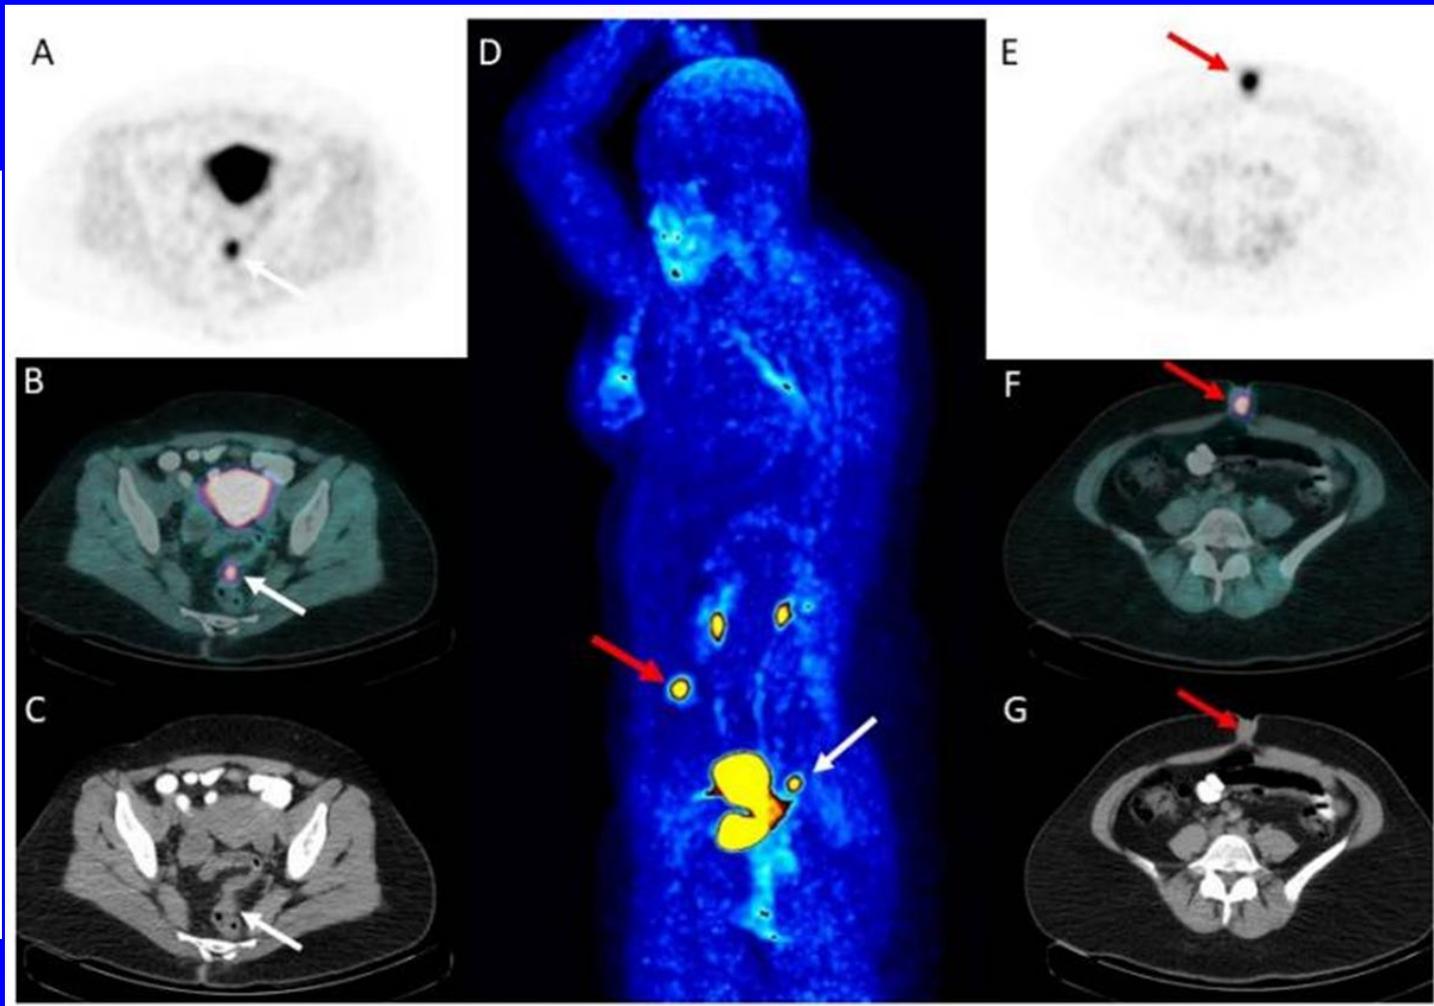

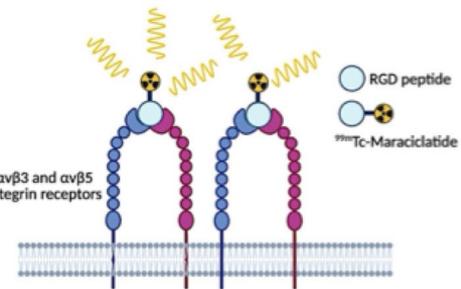

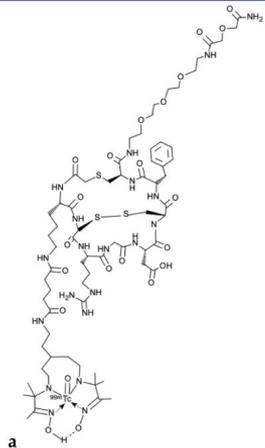

- MRI Findings
 - Endometriomas
 - Deep nodules
 - Adhesions

Endometriosis Biomarkers

Summary of Biomarker Uses:

- Risk assessment Biomarkers:

- Identify those at risk for development of disease
- Opportunity for monitoring or prophylactic therapy

- Diagnostic Biomarker:

- Diagnostic clarity
- Early diagnosis
- Monitor asymptomatic, high-risk individuals

- Prognostic Biomarker

- Predict disease outcome
- Monitor disease recurrence
- Predict disease free interval

- Predictive Biomarker

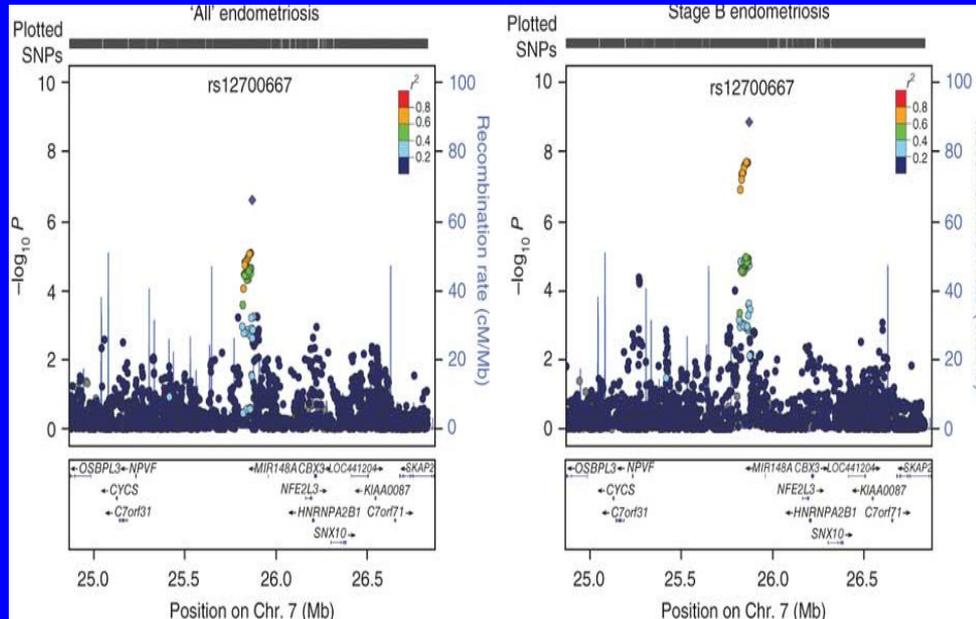

- Choose optimal therapy
- Monitor therapy response
- Alter therapy in setting of emerging resistance

Types of biomarkers by clinical application

- Biomarkers of risk
- Biomarkers for early detection/diagnosis
- Disease outcomes: prognostic biomarkers
- Treatment outcome: predictive biomarkers

Risk Assessment Biomarkers

- Family History
- Exposures and Environmental Factors
- Genetics

Genetic Tests

Exome sequencing

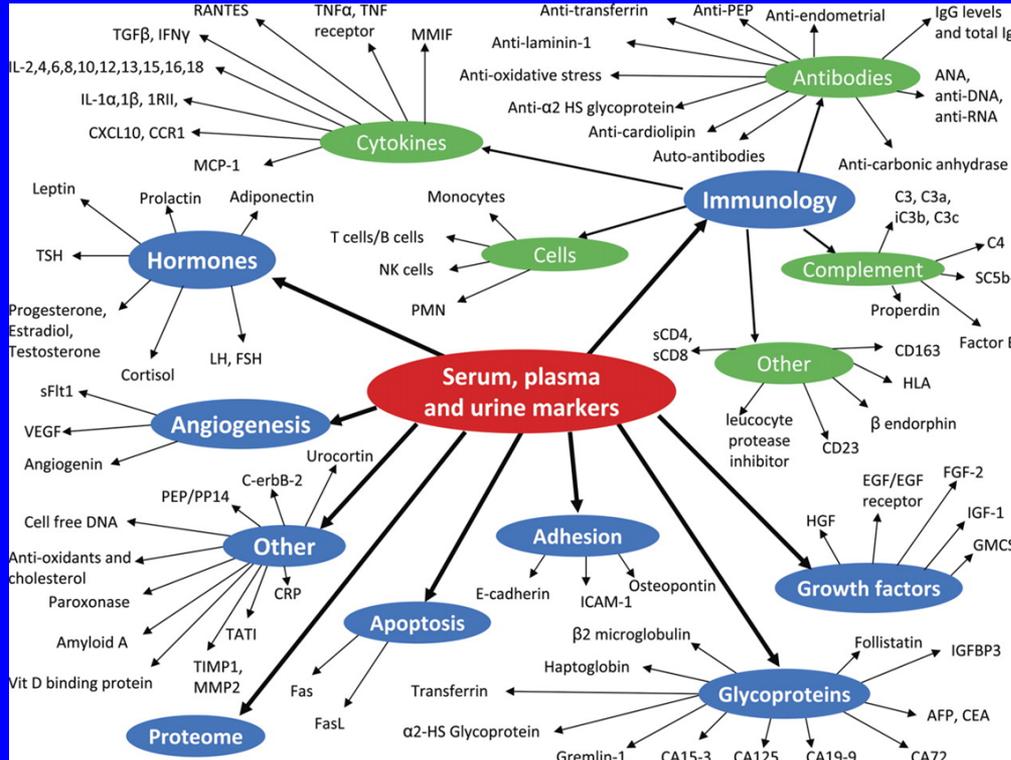

“Low-Frequency, Damaging Mutations in Hundreds of Genes Are Risk Factors for Endometriosis”

Types of biomarkers by clinical application

- Biomarkers of risk
- Biomarkers for early detection/diagnosis
- Disease outcomes: prognostic biomarkers
- Treatment outcome: predictive biomarkers

Serum Biomarkers

- Over 200 different serum biomarkers have been proposed, yet none have adequate specificity and sensitivity.

Where are we now with biomarkers?

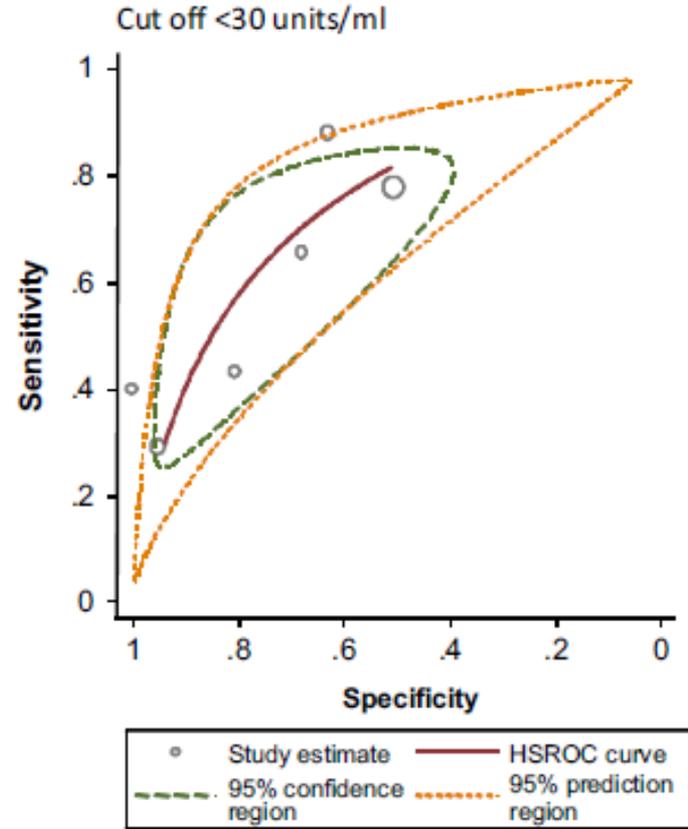

The most widely-used at present is CA-125, a marker that is inadequate on its own in terms of sensitivity and specificity

Biomarker	Sensitivity	Specificity
Anti-endometrial antibodies	81%	75%
IL-6	63%	69%
CA 19-9	36%	87%
CA 125 (low cutoff)	70%	64%
CA 125 (high cutoff)	50%	91%

CA-125

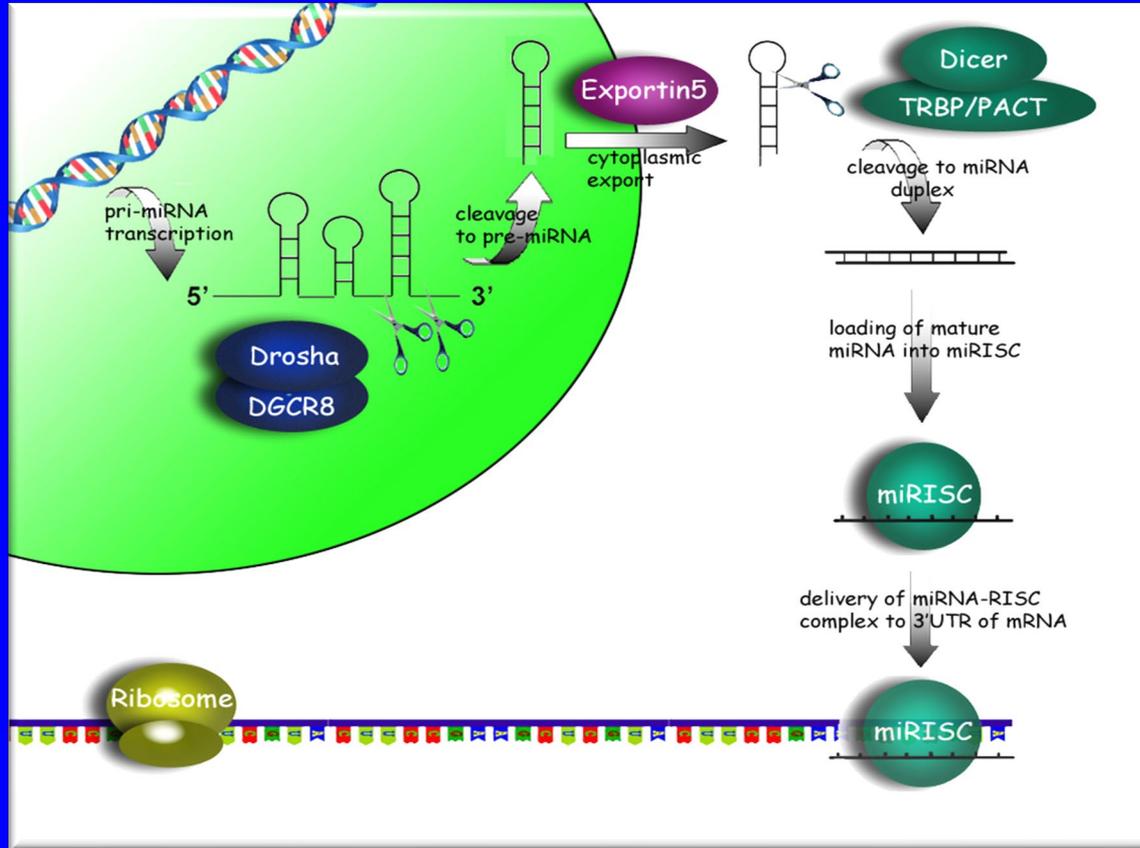

Reference (n = Number of Patients)	Assay; Timing of Sample Collection	Stage	Sensitivity (%)	Specificity (%)
Barbieri et al, 1986 ⁹¹ (n = 147)	Standard assay, timing of sample collection unknown	All	17	96
		III+IV	54	96
Patton et al, 1986 ¹⁷⁷ (n = 113)	Standard assay, timing of sample collection unknown	All	14	93
		III+IV	18	93
Pittaway and Favez, 1986 ⁹² (n = 414)	Standard assay (cutoff level 30 IU/mL), follicular phase	All	17	93
		III+IV	42	93
Koninckx et al, 1992 ²⁴ (n = 259)	Standard assay, late luteal phase	All	13	96
		III+IV	31	94
O'Shaughnessy et al, 1993 ⁹⁶ (n = 100)	Standard assay, menstrual	All	27	100
		III+IV	67	100
Hornstein et al, 1995 ⁹⁷ (n = 123)	Standard assay, early follicular phase CA 125 II assay, early follicular phase	All	16	92
		III+IV	40	92
		III+IV	60	94
Medl et al, 1997 ¹¹⁴ (n = 368)	Standard assay, timing of sample collection unknown	All	36	92
		III+IV	44	86
Chen et al, 1998 ¹⁰⁷ (n = 157)	CA 125 II assay, luteal phase	All	61	88
		III+IV	87	88

Decreased Let-7 micro RNAs in Endometriosis

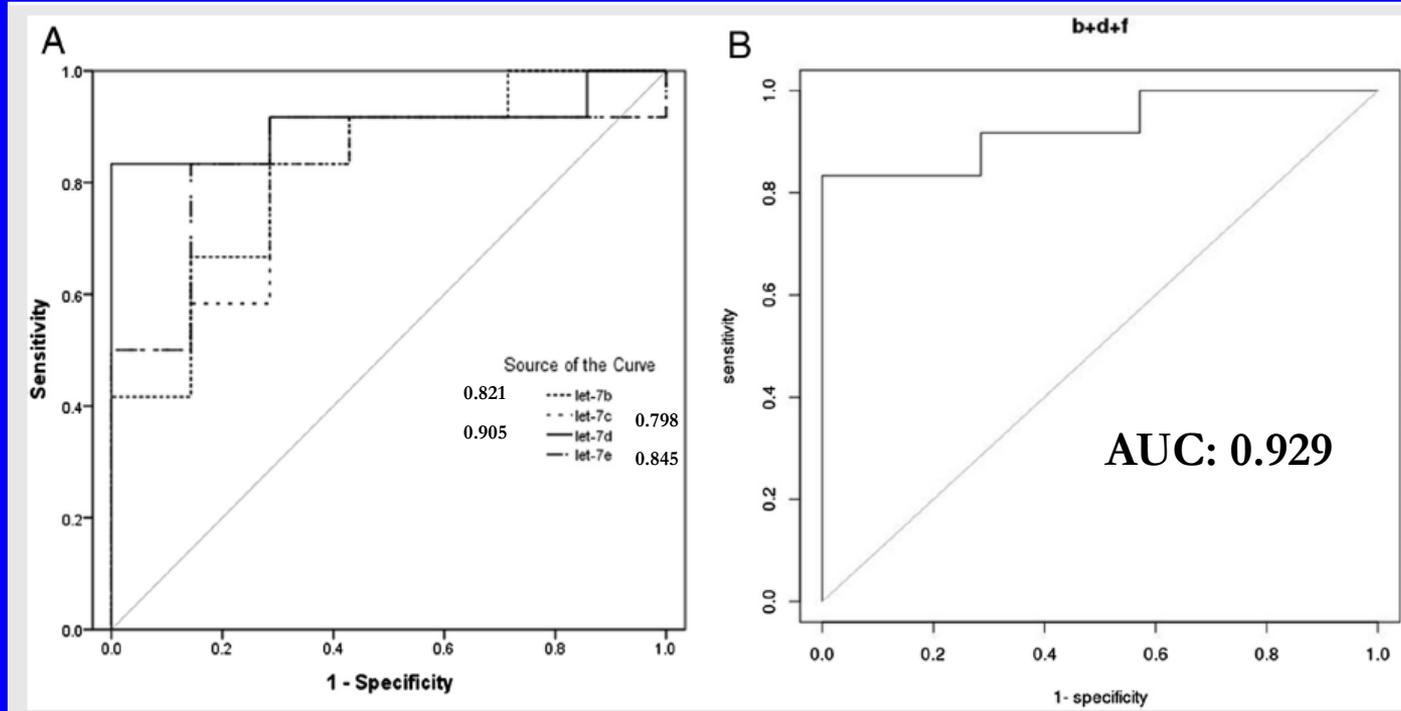

Let-7 signaling

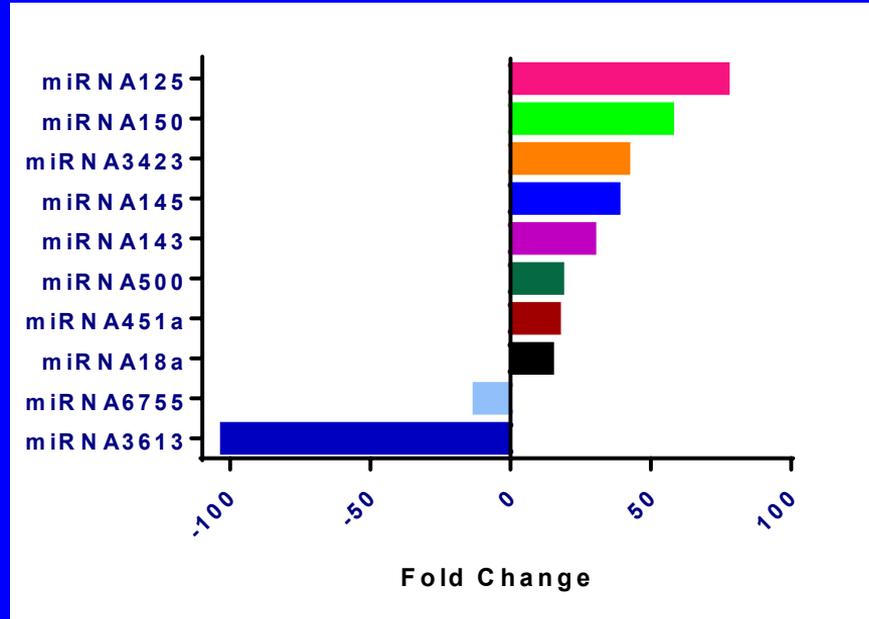

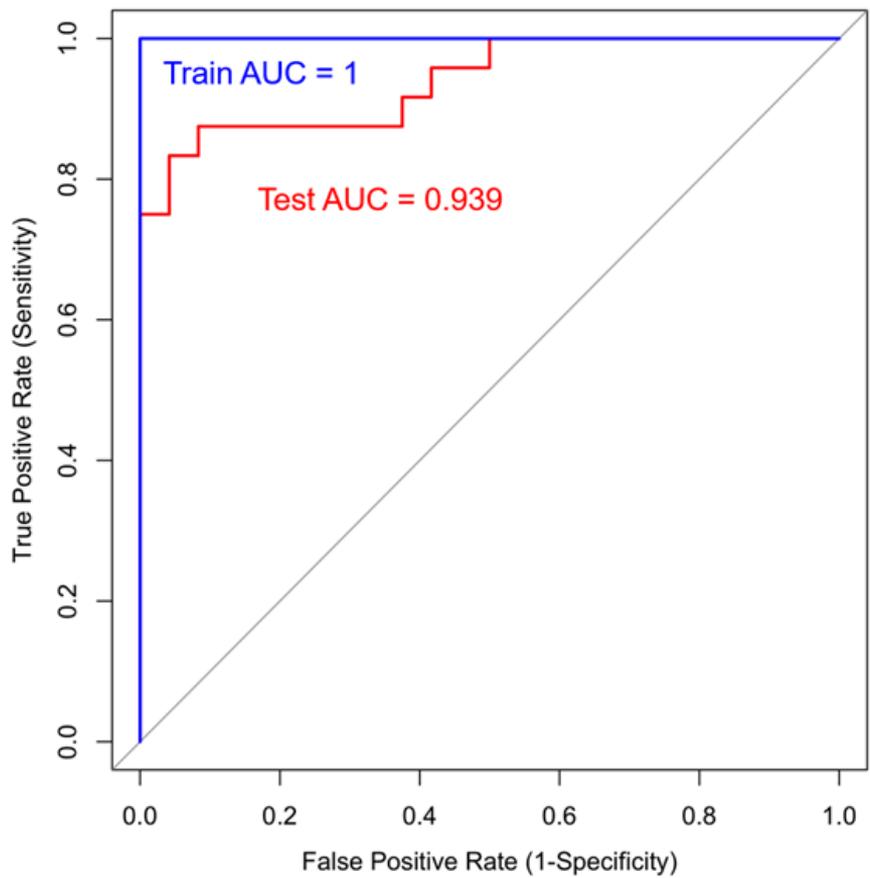

Circulating miRNAs as Serum Biomarkers of Endometriosis

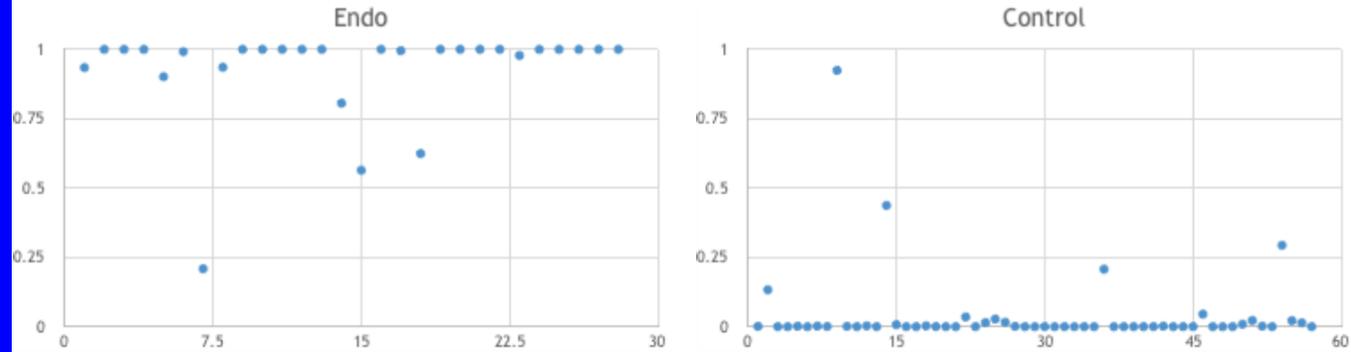

ROC Curves of let7 During the Proliferative Phase of Menstrual Cycle

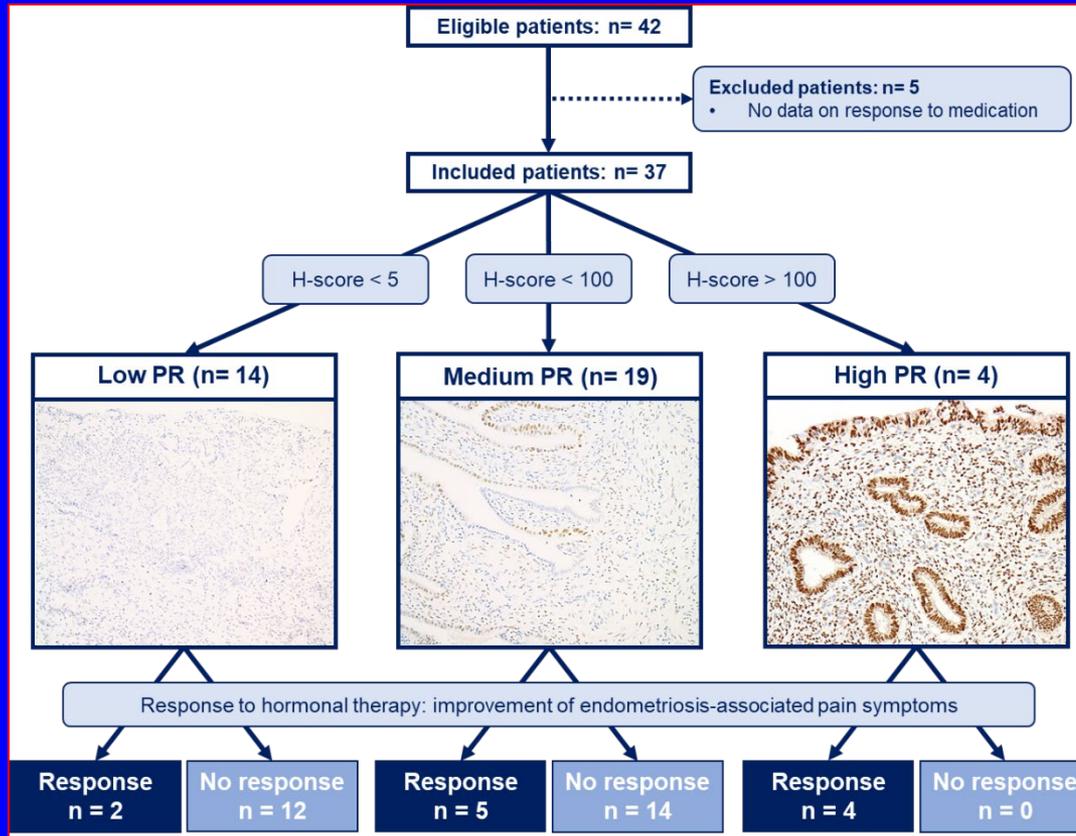

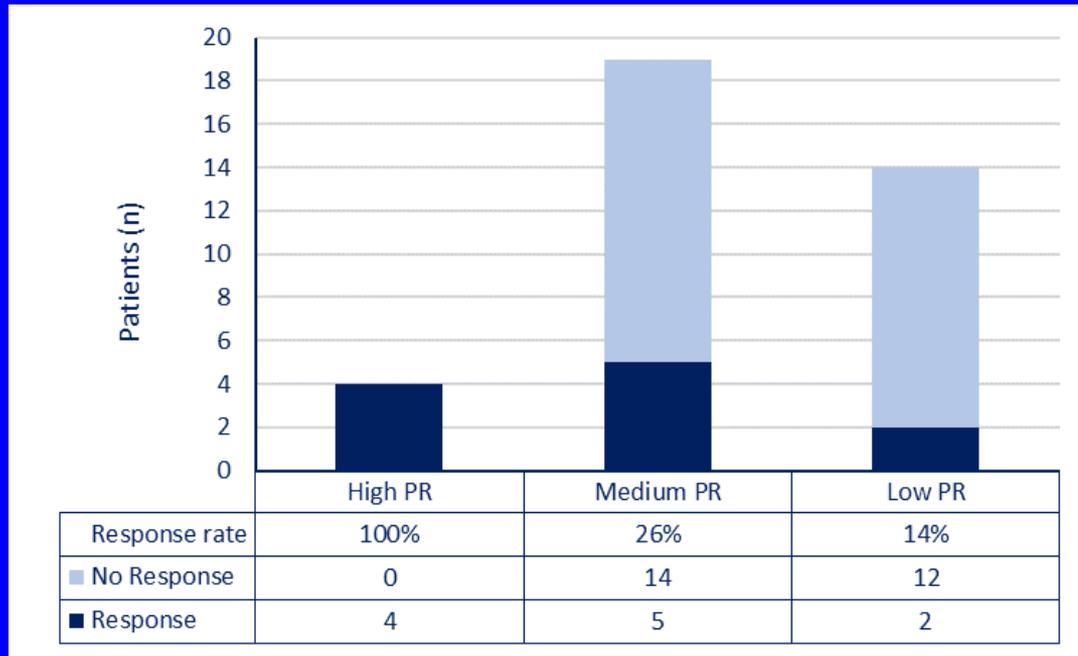

5 marker model

- Algorithm able to provide clear distinction between endometriosis and other benign gynecological pathologies
- Only 1 false positive and 1 false negative observed in above analysis of algorithm performance in prospective dataset

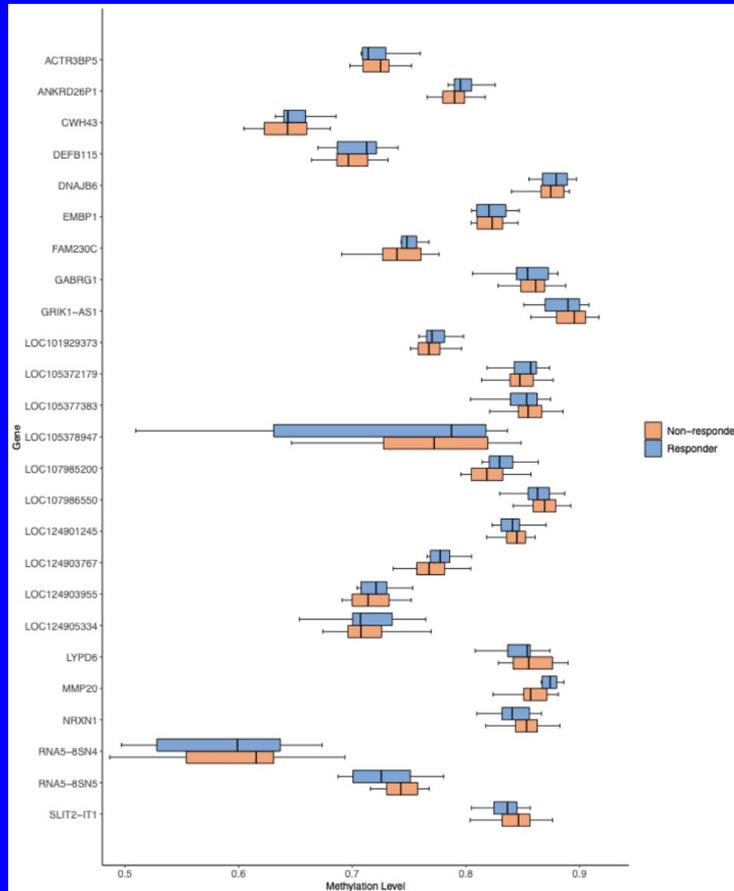

Markers of Progestin Resistance

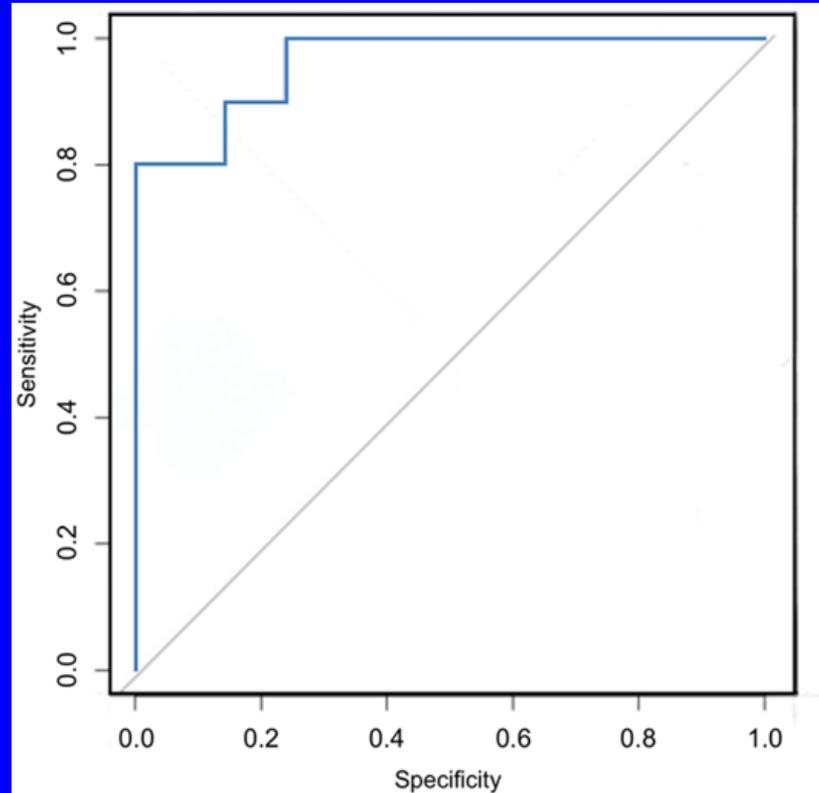

- PR status was significantly associated ($p= 0.004$) with response to progestin therapy.
- All patients with high PR responded to progestin therapy.
- 86% of patients in the low PR group did not respond to progestin therapy.
- The medium PR group had a response rate of 26%
